Today's speakers

Till Bachmann is Professor of Molecular Diagnostics and Infection and Deputy Head of Infection Medicine at Edinburgh Medical School:Biomedical Sciences at the University of Edinburgh. Till is an expert in point of care (POC) detection, infectious diseases and antimicrobial resistance, conducting research at the interface of clinical microbiology and diagnostics.

Amrita Sukrity is the founder of Spot Healthcare Solutions Pvt Ltd which is a start-up in India working in the field of affordable diagnostics. The start-up aims to develop multiple solutions in the space of maternal and child health and is currently piloting an algorithm for detection and monitoring of neonatal sepsis.

David Anderson is Deputy Director (Partnerships) and co-head of the Global Health Diagnostics Laboratory at the Burnet Institute in Melbourne, Australia, where he has spent his entire professional career. His work has led to diagnostic innovations including the Visitect® CD4 POC test for monitoring of CD4+ T-cells in HIV, which serves as a paradigm for future cell-based POC tests including CD64 in sepsis and severe infection, and novel POC tests for liver disease.

LONGITUDE PRIZE

£10 Million Prize Fund
£8 Million payout

1 Winner

First past the post

5 year + international prize

Funded by Nesta & Innovate UK

nesta

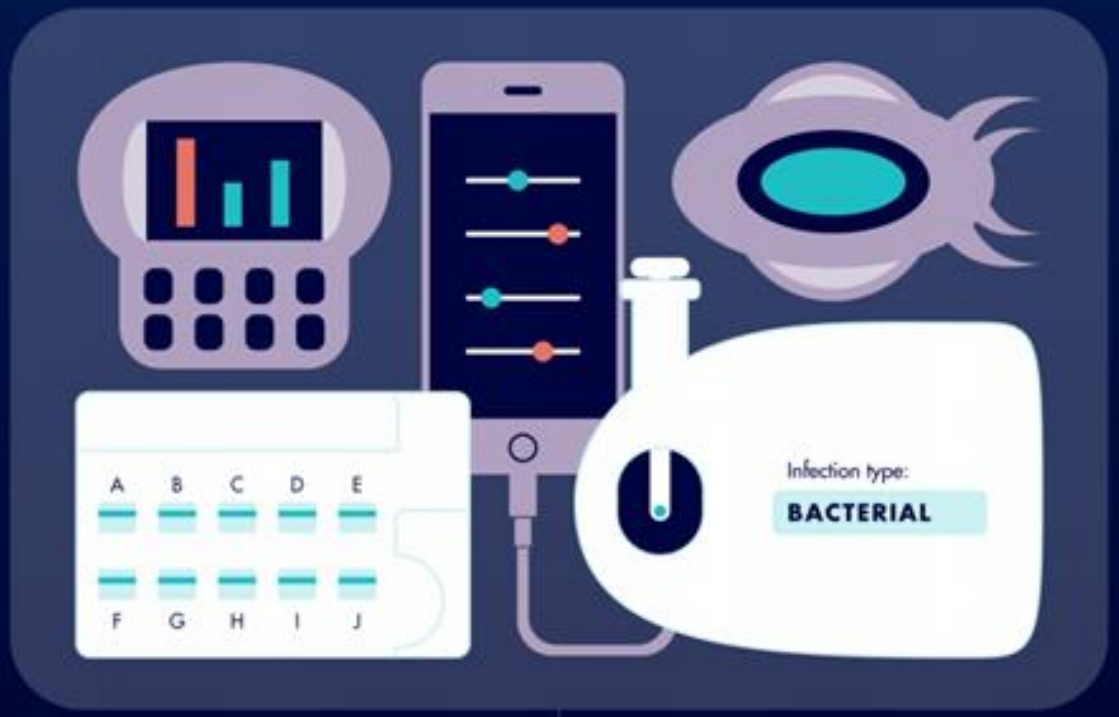
A **£8 million global prize** that will reward a transformative, rapid, accurate, and affordable **point-of-care** diagnostic test that can significantly reduce antibiotic misuse or overuse, anywhere in the world.

What do competitors need to do to win?

nesta

LONGITUDE PRIZE

WHAT KIND OF TEST COULD WIN THE LONGITUDE PRIZE?



THE WINNING TEST MUST BE...

NEEDED
Improve the antibiotic treatment decision of a globally occurring problem

ACCURATE
Eliminate harmful treatment decisions and give confidence to the user

AFFORDABLE
Affordable for purchase and use everywhere that it is needed

RAPID
Sample collection to result in less than 30 minutes

EASY TO USE
Can be used and interpreted anywhere in the world with minimal training

CONNECTED
Tests with built-in data-recording and transmission will be favoured

SAFE
The benefits far outweigh any risks

SCALABLE
A plan for full-scale manufacture and distribution

ENVIRONMENTAL STABILITY

EASILY CARRIED

NO COLD CHAIN

NO MAINS POWER

Who are our teams?

57 Teams

19 UK
13 India
10 US
3 Australia
3 Sweden

Rapid Appropriate Antimicrobial Therapy is Essential for Survival

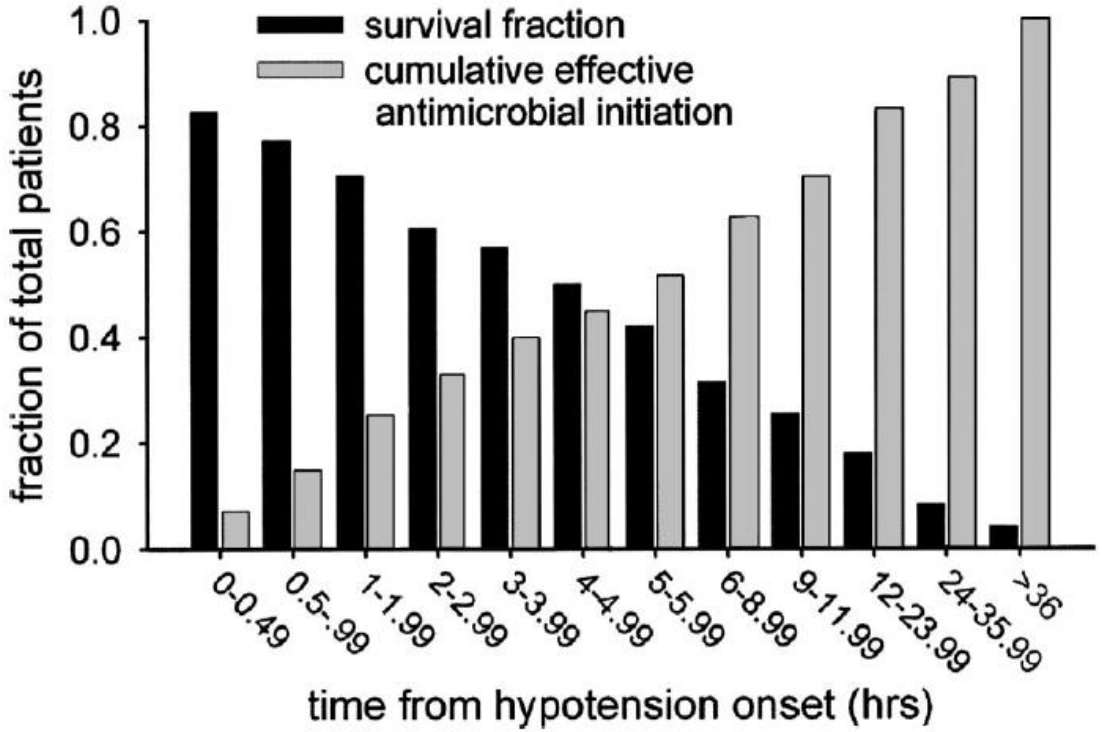

Figure 1. Cumulative effective antimicrobial initiation following onset of septic shock-associated hypotension and associated survival. The x-axis represents time (hrs) following first documentation of septic shock-associated hypotension. *Black bars* represent the fraction of patients surviving to hospital discharge for effective therapy initiated within the given time interval. The *gray bars* represent the cumulative fraction of patients having received effective antimicrobials at any given time point.

Duration of hypotension before initiation of effective antimicrobial therapy is the critical determinant of survival in human septic shock. Kumar A, Roberts D, Wood KE, Light B, Parrillo JE, Sharma S, Suppes R, Feinstein D, Zanotti S, Taiberg L, Gurka D, Kumar A, Cheang M. Crit Care Med. 2006 Jun;34(6):1589-96.

Clinical Response to Sepsis - Sepsis 6 Bundle

Action (complete ALL within 1 hour)	Why we do this
1. Administer oxygen Aim to keep saturations >94% (88-92% if at risk of CO_2 retention e.g. COPD)	To improve the oxygen content of the blood, and therefore its delivery to the tissues
2. Take blood cultures At least a peripheral set. Consider e.g. CSF, urine, sputum. **Think source control!** Call surgeon/ radiologist if needed	To help identify pathogens, to determine likely source of infection & guide antimicrobial therapy
3. Give IV antibiotics According to Trust protocol Consider allergies prior to administration	To control the underlying infection, removing the trigger for immune overreaction
4. Give IV fluids If hypotensive/ lactate >2 mmol/l, up to 30ml/kg Give 500ml stat if not hypotensive and lactate normal	To improve preload to the heart by correcting hypovolaemia, improving cardiac output and BP
5. Check serial lactates Corroborate high VBG lactate with arterial sample **If lactate >4 mmol/L, recheck after each 10ml/kg challenge and call Critical Care**	High lactate indicates hypoperfusion- response of lactate helps to guide resuscitation
6. Measure urine output May require urinary catheter Ensure fluid balance chart commenced & completed hourly	Urine output falls if the patient is hypovolaemic, also provides an indicator of adequate cardiac output

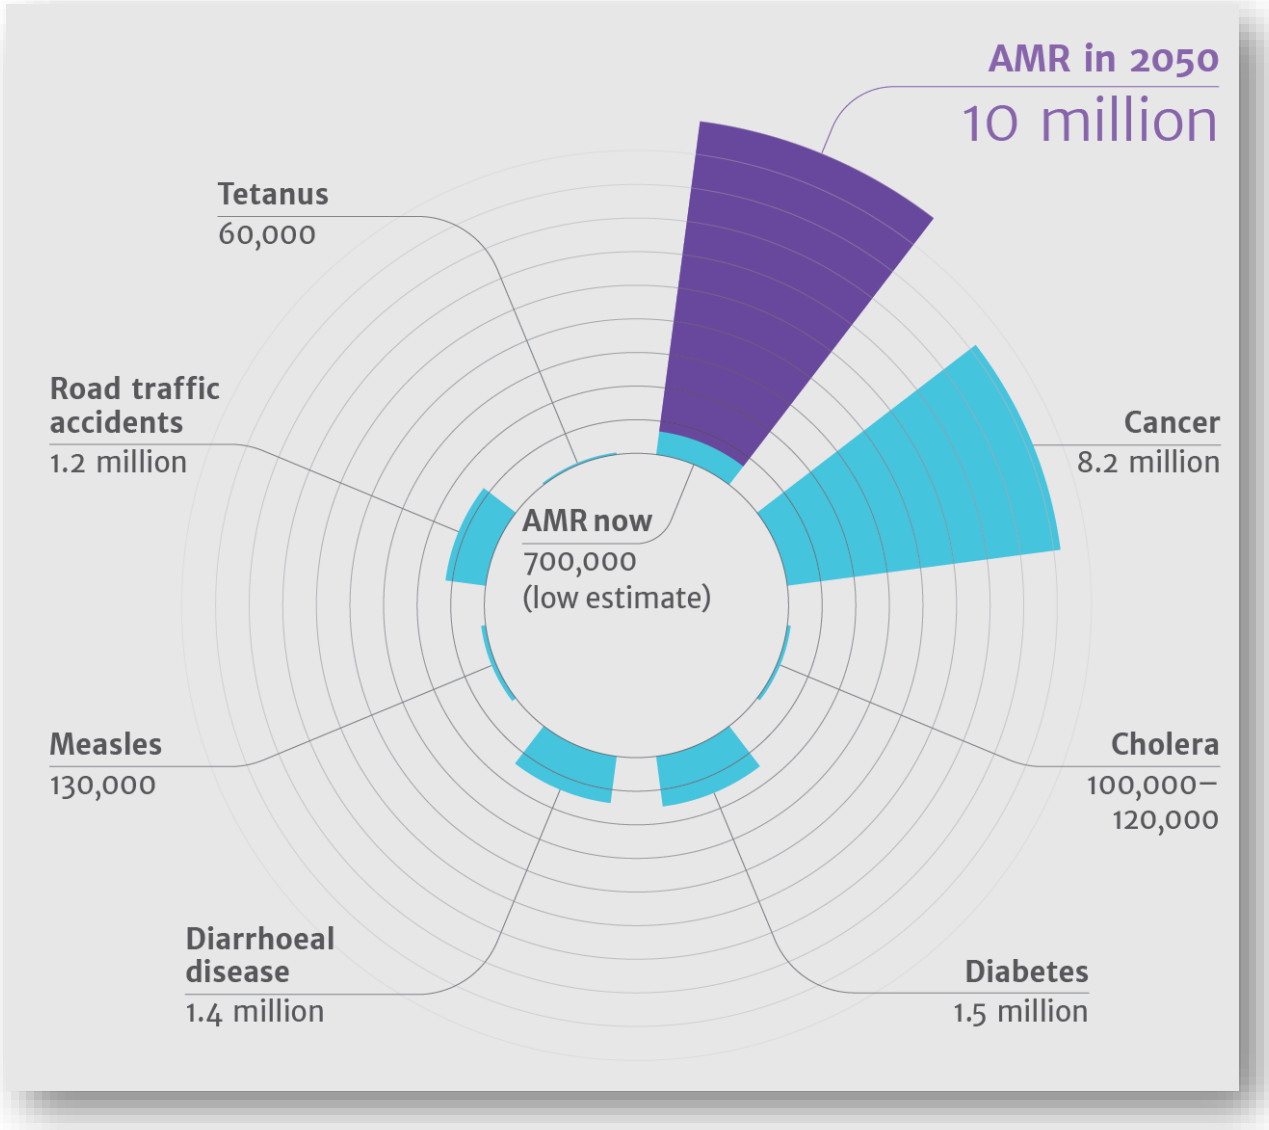
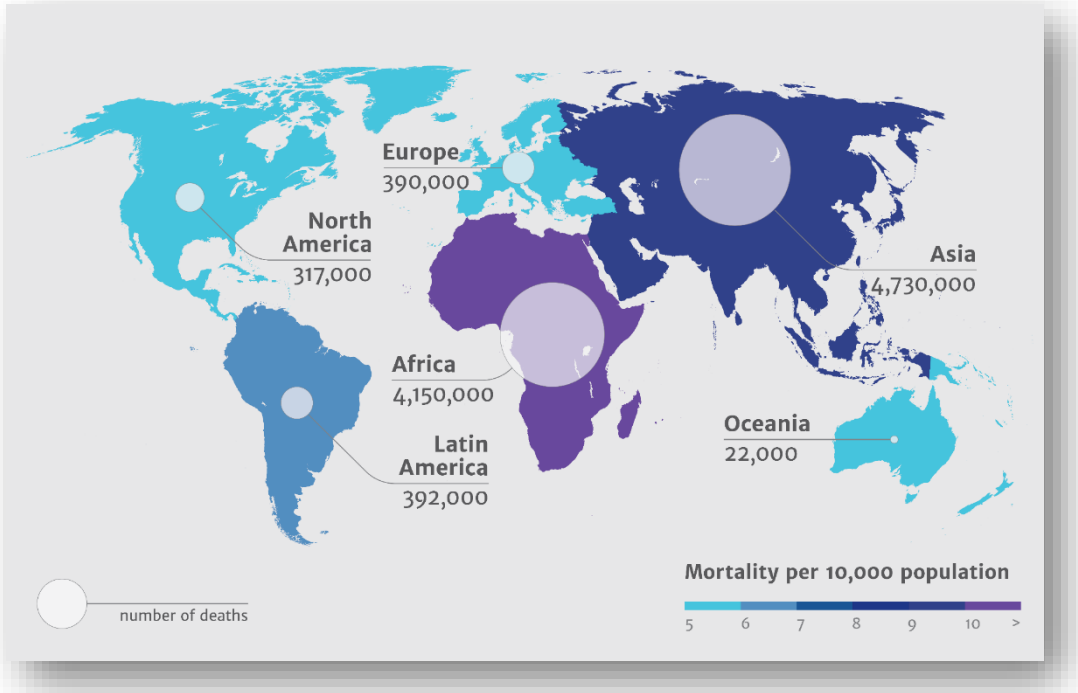
The **Global Threat** of Antimicrobial Resistance





Antimicrobial Resistance: Tackling a crisis for the health and wealth of nations. The Review on Antimicrobial Resistance Chaired by Jim O'Neill December 2014 http://amr-review.org/

TACKLING ANTIMICROBIAL RESISTANCE ON TEN FRONTS

http://amr-review.org

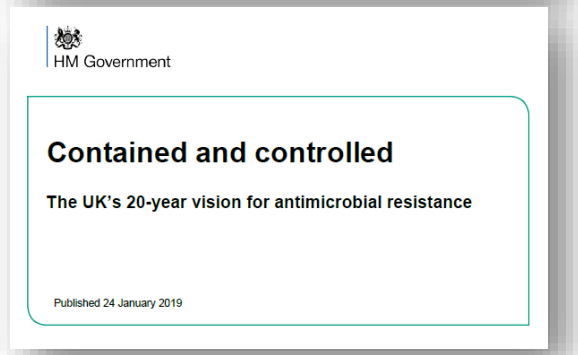
- Public awareness
- Sanitation and hygiene
- Antibiotics in agriculture and the environment
- Vaccines and alternatives
- Surveillance
- Rapid diagnostics

There has been very little progress on the review's central and most expensive recommendations for transforming research and development incentives for antibiotics, vaccines and diagnostics.

Review of Progress on Antimicrobial Resistance: Background and Analysis, Charles Clift, Centre on Global Health Security | October 2019, Chatham House

"I call on the governments of the richest countries to mandate now that by 2020, all antibiotic prescriptions will need to be informed by up-to-date surveillance information and a rapid diagnostic test wherever one exists."

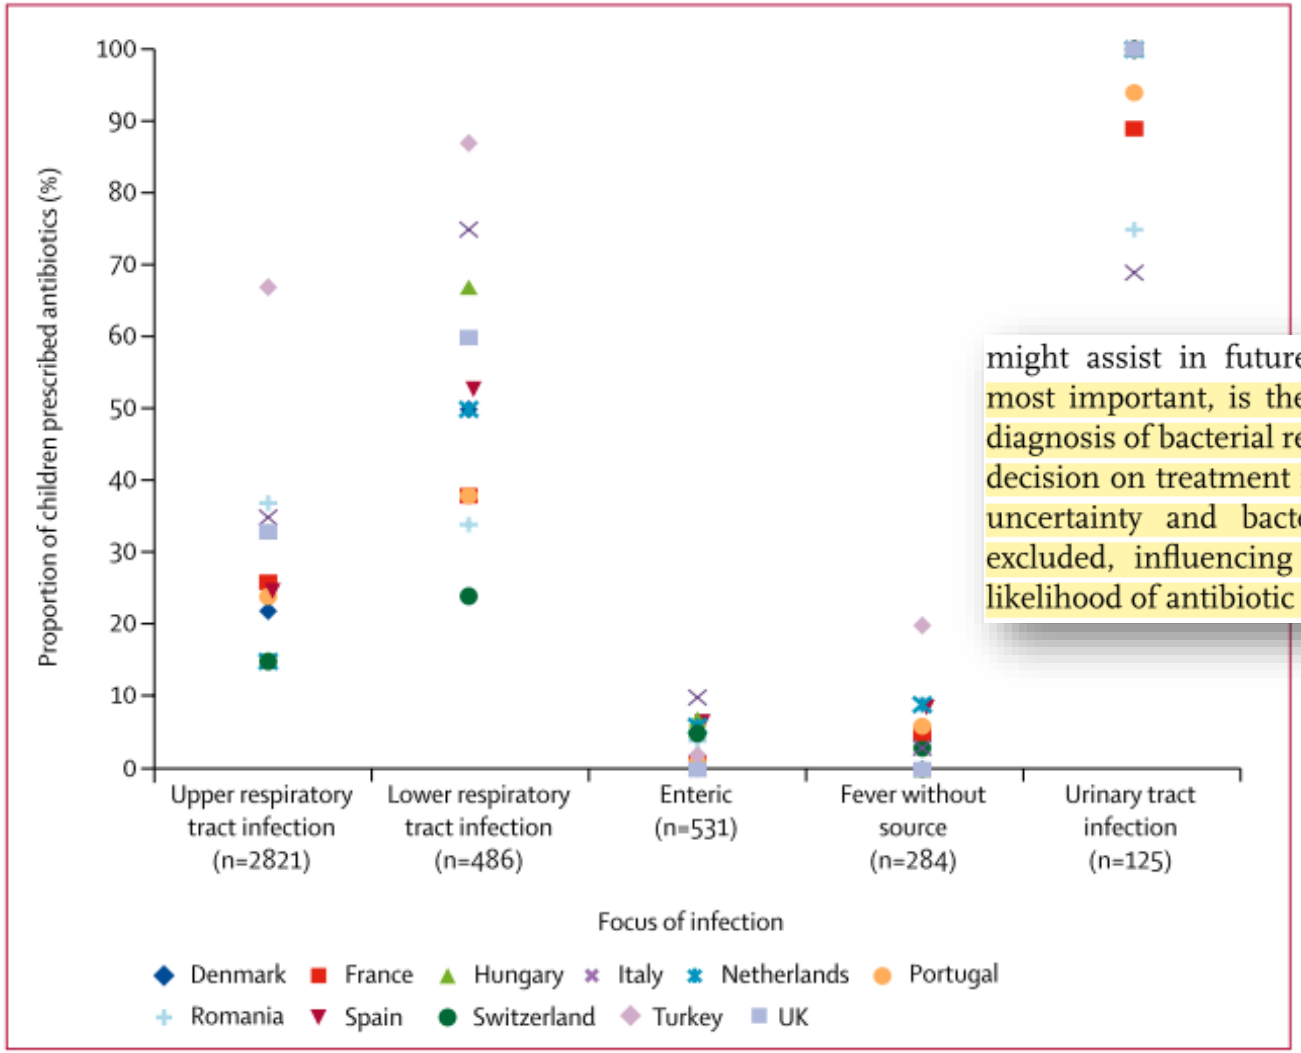
AMR Review May 19, 2016 – Tackling Drug-Resistant Infections Globally: final report and recommendations



"… be able to report on the percentage of prescriptions supported by a diagnostic test or decision support tool by 2024."

For Dx: UK AMR Diagnostics Collaborative

Variability of **Antibiotic Prescription** for Febrile Children



might assist in future studies. Second, and probably most important, is the lack of a gold standard for the diagnosis of bacterial respiratory tract infections. When a decision on treatment is made, there is often diagnostic uncertainty and bacterial causes can often not be excluded, influencing diagnostic assessment and the likelihood of antibiotic prescription.[5]

Figure 3: **Variability in antibiotic prescription across countries for the most frequent foci of infection in 4560 children without comorbidities**

Antibiotic prescription for febrile children in European emergency departments: a cross-sectional, observational study. van de Maat J, van de Voort E, Mintegi S, Gervaix A, Nieboer D, Moll H, Oostenbrink R; Research in European Pediatric Emergency Medicine study group. Lancet Infect Dis. 2019 Feb 28. pii: S1473-3099(18)30672-8

WHO AMR Diagnostics **Landscape & Gap Analysis**

Table 1. Gaps in syndromic testing at Level I and Level II healthcare facilities*

Purpose Syndromes	Fever without a known source	Sepsis	Sore throat, cough, URTI	TB[1]	Pneumonia, LRTI	Diarrhea	Visible skin/soft tissue infection	Wounds (traumatic and chronic)	Urethral and vaginal discharge	UTI
Level I										
Bacteria vs other	A	NA	A	A	A	A	NA	NA	NA	A[3]
Bacterial ID (culture, RDT, ..)	NA	NA	A, B	NA	A, B	NA	NA	NA	A, B	NA
Antibiotic Susceptibility	NA	NA	NA	NA	NA	NA	NA	NA	A, B	NA
Resistance Testing	NA	NA	NA	NA	NA	NA	NA	NA	A, B	NA
Level II										
Bacteria vs other	A	NA	A	A	A	A	A	A	NA	A[3]
Bacterial ID	B, C	B, C	A, B, C	A, B, C	A, B, C	B[2], C	A, B, C	A, B, C	A, B	A, B, C
Antibiotic Susceptibility	B, C	B, C	C	A, B, C	B, C	B[2], C	B, C	B, C	B, C	A, B, C
Resistance Testing	B, C	B, C	C	A, B, C	B, C	B[2], C	B, C	B, C	B, C	C

If test desired	Available	Not fully available or ideal	Not available

A Reduce unnecessary antibiotic prescriptions, **B** Guidance for appropriate treatment of drug-resistant infections, **C** Surveillance

*Based on informal consensus of participants attending the Technical Consultation on In Vitro Diagnostics for AMR.

Notes:

[1] MTB, the cause of human tuberculosis, was not subjected to review for inclusion in this prioritization exercise as it is already a globally established priority. And although priority TPPs to stimulate product development have been developed, more innovative new TB diagnostics are urgently needed. The section on TB was provided by the WHO Global TB Programme.

[2] In case it is needed in special populations.

[3] Infection marker.

Creating point-of-care diagnostics for neonatal sepsis.

Amrita Sukrity
Founder, SpotSense
GARDP-REVIVE Webinar 26th Nov 2019

spotsense®

Making Healthcare Simple

Current diagnostics landscape for neonatal sepsis.

Modules in treatment

1) Antimicrobial therapy to fight an underlying infection.

2) Supportive care to maintain physiology

Questions in Diagnostics

1) Is there is an infection?

2) How severe is the underlying condition?

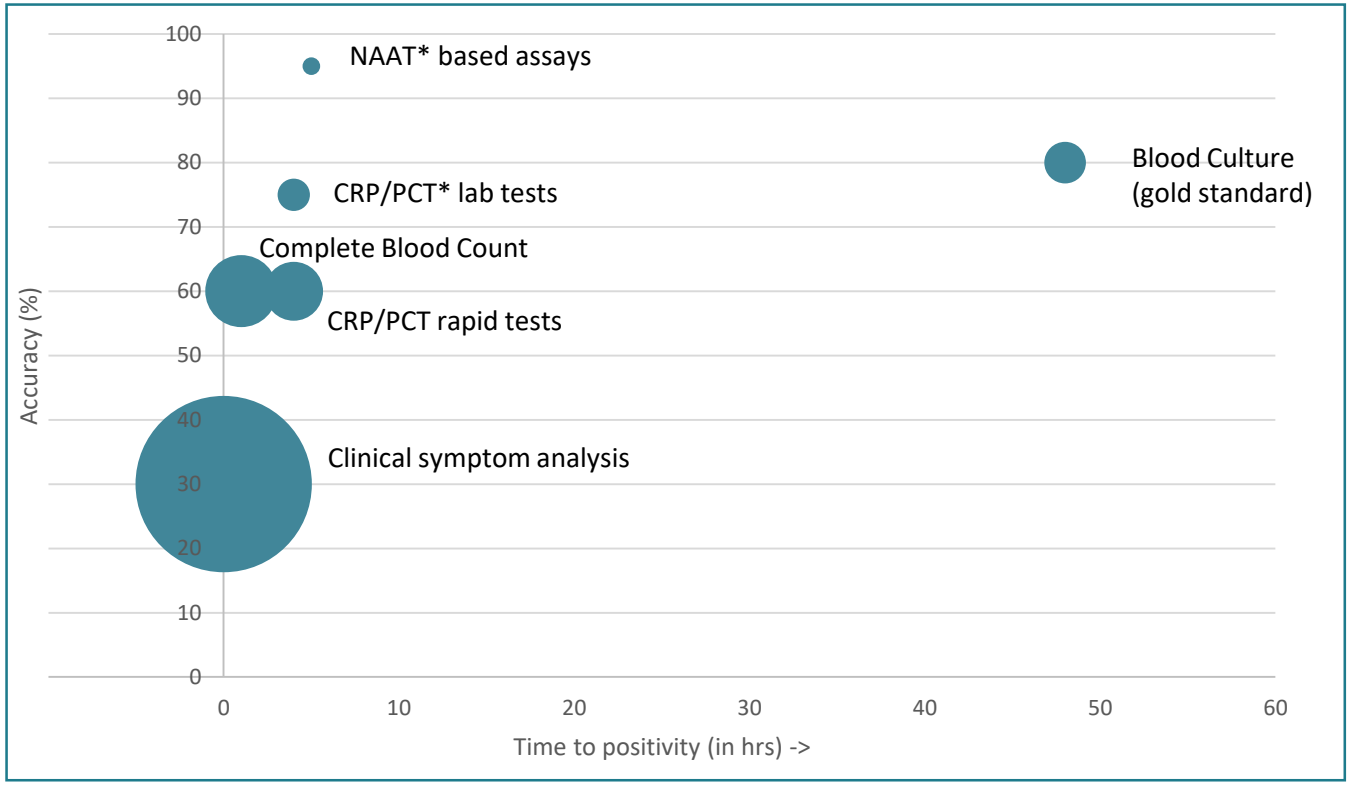

Chart 1: Current diagnostic protocols, their Time-to-positivity, accuracy and accessibility parameters. The radius of bubbles indicate accessibility of these tests at community health level.

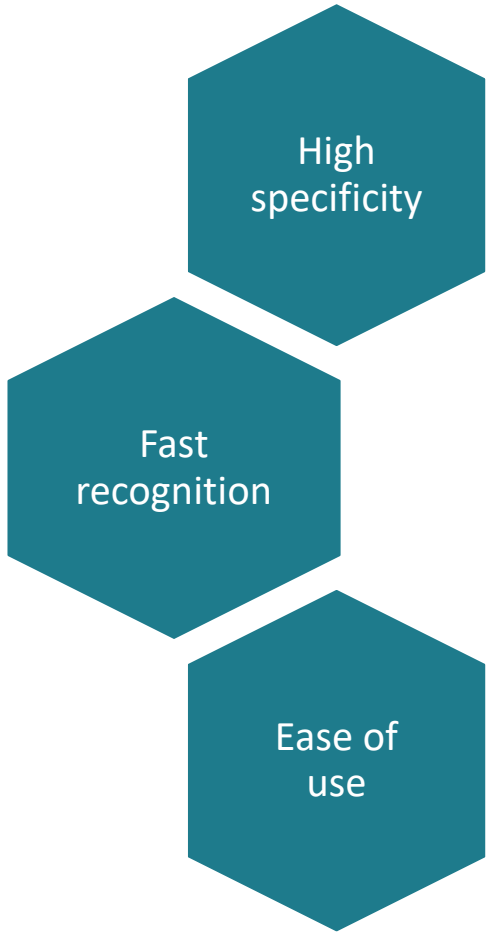
*NAAT - nucleic acid amplification test
CRP – C-reactive protein
PCT - Procalcitonin

Requirements for a point-of-care test to be used at the community.

- Most sepsis protocols focus on initiating treatment within 60 min of presentation of sepsis.
- Newborns with sepsis who are treated with antibiotics within 60 min of presentation have significantly better outcomes than those with delayed treatment.



- Blood culture, considered a gold standard for sepsis can indicate false negatives in 20-40% of sepsis cases.
- While physicians do want to know the causative organism, the choice of antibiotics doesn't always depend on the result.
- Prolonged early empirical antibiotic therapy is also known to be associated with increased risk of sepsis, NEC* and death.

- The delay in start of therapy is very often attributed to a delay in referral, especially when clinical presentation isn't conclusive for sepsis.
- After start of treatment, continuous monitoring is a challenge as frequent blood draws are not advisable.

*NEC – Necrotizing enterocolitis

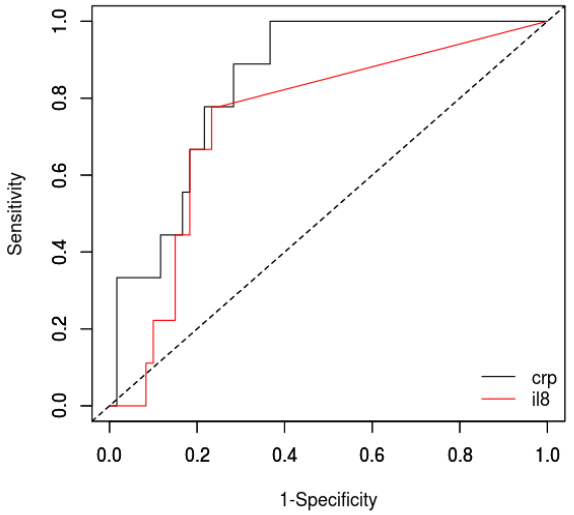
Understanding the role of Interleukin 8/IL8 (CXCL8) in neonatal immunology.

Why did we choose IL8 as our 'biomarker of choice'?

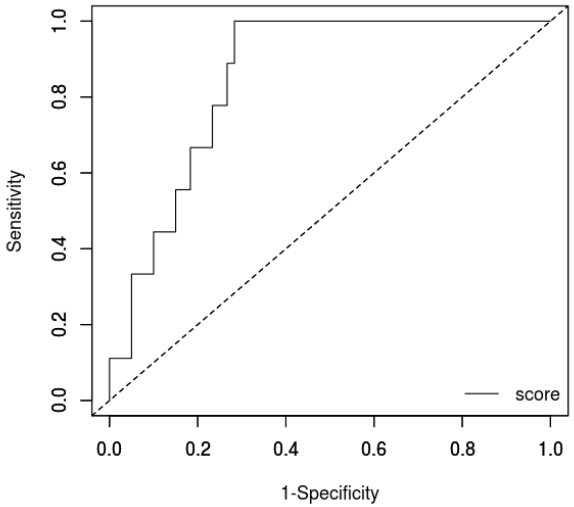
- There isn't a significant physiological change in IL8 production based on gestational age at birth.
- IL8 production is evident in babies with gestational age as low as 23 weeks and then remains mostly stable for healthy newborns.
- Previous literature has shown a marked rise in IL8 production which precedes a rise in C-Reactive Protein aiding in fast recognition of sepsis.
- Some previous studies have shown that IL8 can be correlated with severity of sepsis.

However, in case of early onset sepsis

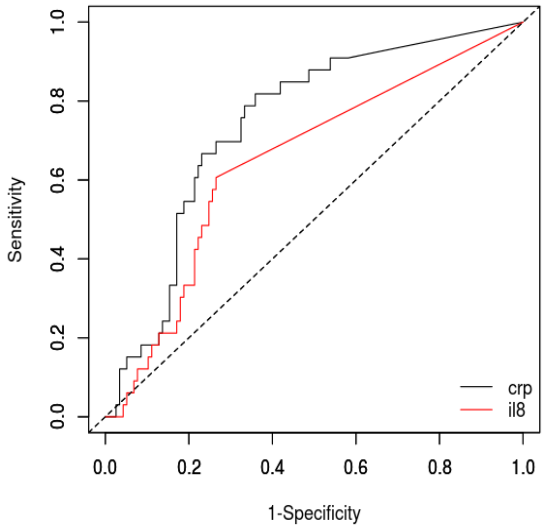
- Significantly lower amounts of monocytes and neutrophils are seen to be recruited during infection.
- A reduction in expression of adhesion molecules is also noticed leading to difficulties in migration of neutrophils to the site of infection.
- IL8 production can still be very readily seen to be provoked by antigen receptor engagement of T cells in preterm infants, but levels remain low for first 3 days.



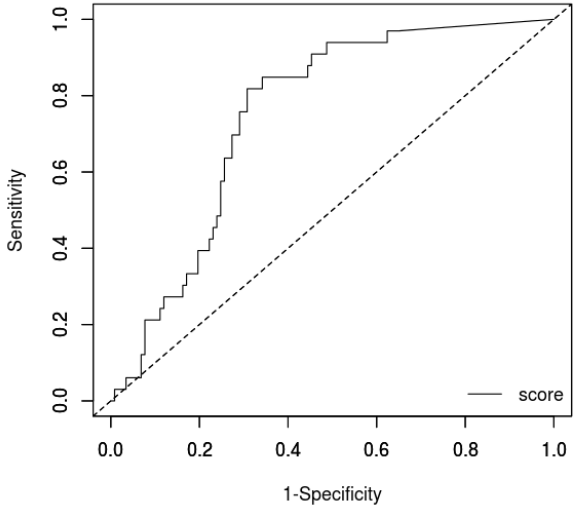
ROC curve for salivary IL8 and salivary CRP for late onset bacteremia on the first screening test.



ROC curve for combined score for late onset bacteremia on the first screening test.



ROC curve for salivary IL8 and salivary CRP for late onset bacteremia across all tests (after antibiotics have begun).



ROC curve for combined score for late onset bacteremia across all tests (after antibiotics have begun).

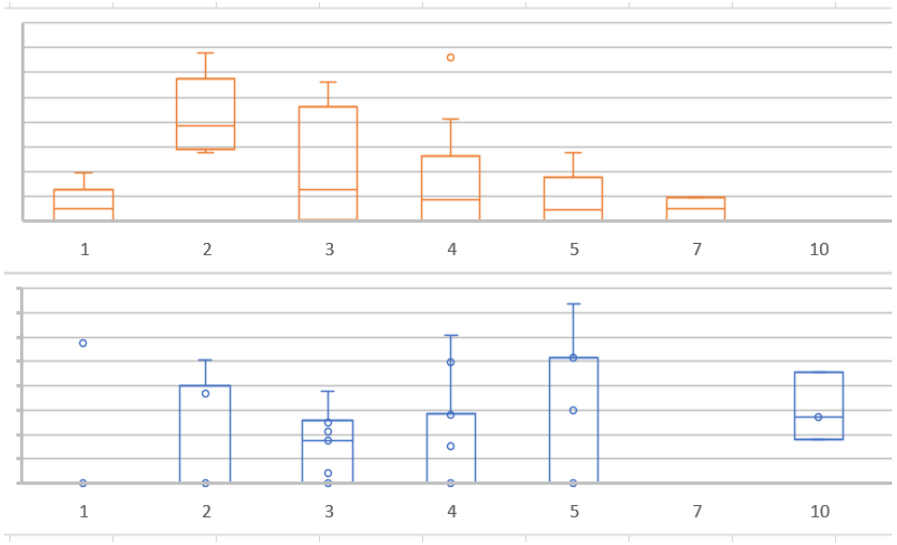
Predicting late onset culture positive sepsis (bacteremia) using a combined score of salivary IL8 and salivary CRP.

What are some of the trends for early onset sepsis?

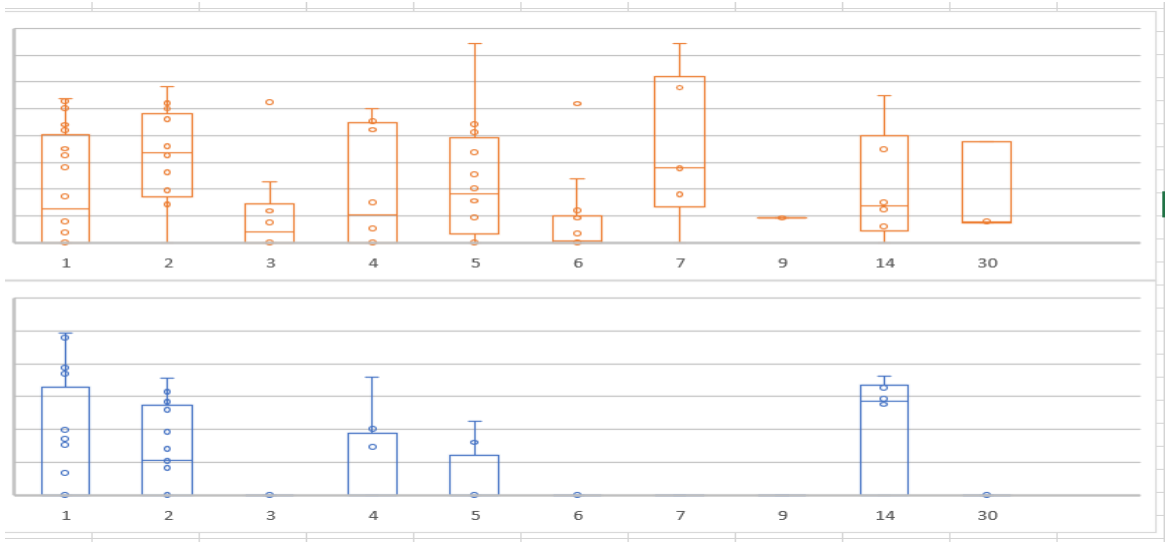
Variation of salivary IL8 and salivary CRP levels with gestational age

Parameter	P-value
Gestational age and salivary IL8 levels	0.0045
Gestational age and salivary CRP levels	0.0002

Variation of salivary IL8 and salivary CRP levels with physiological age

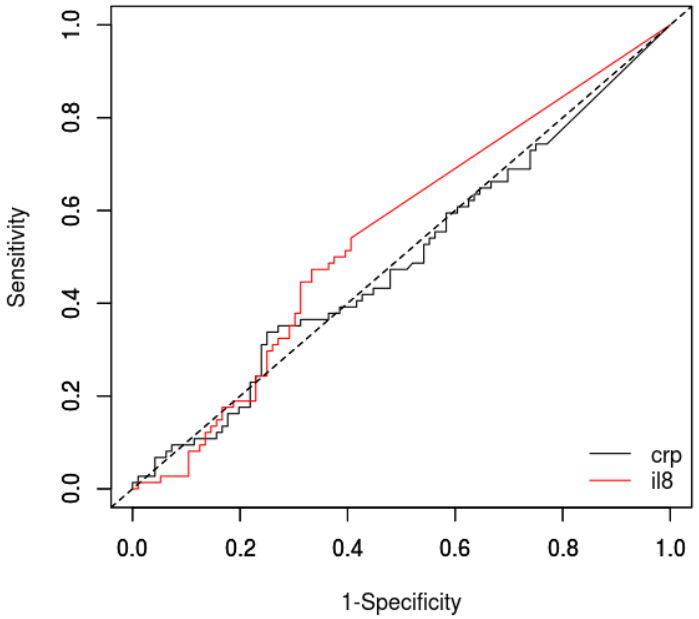


Variations across CRP (top) and IL8 (bottom) levels against physiological age for healthy babies without any comorbidities.

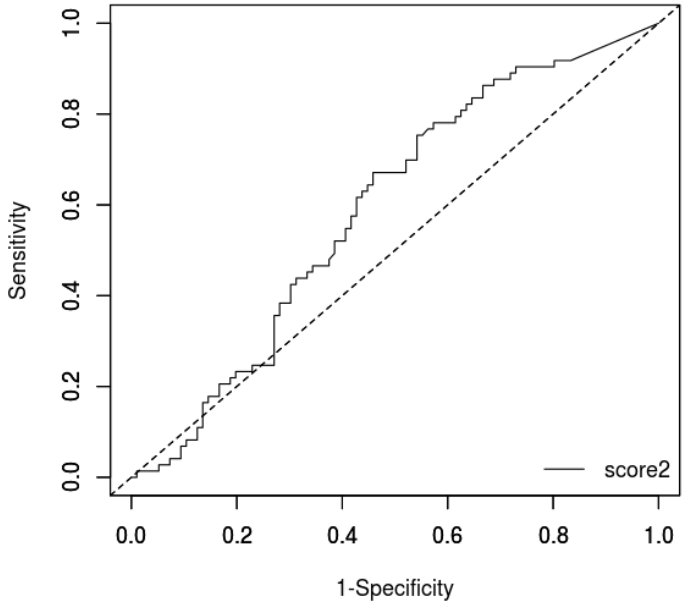


Variations across CRP (top) and IL8 (bottom) levels against physiological age for babies with early onset sepsis.

Predicting early onset culture-positive sepsis (bacteremia) using a combined score of salivary IL8 and salivary CRP.



ROC curve for salivary IL8 and salivary CRP for early onset sepsis across all tests (after antibiotics have begun).

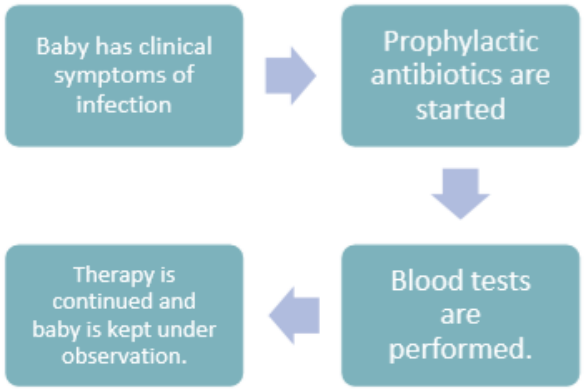


ROC curve for combined score for early onset sepsis across all tests after adjusting for gestational and physiological age (after antibiotics have begun).

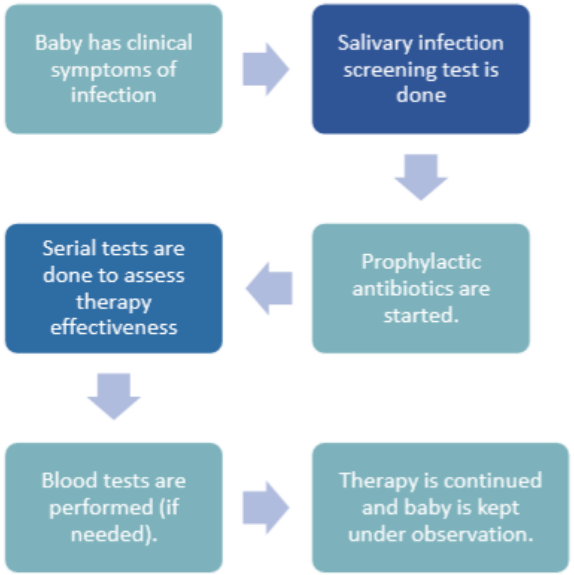
For early onset, especially for babies who are 48 hours old, a CRP and IL8 salivary test may not work for screening and should be used in addition with clinical symptom analysis.

Where do we go from here?

Current 'standard-of-diagnostic' for neonatal sepsis



Proposed 'standard-of-diagnostic' for neonatal sepsis



Some unanswered questions

- Would there be a difference in the cut-off points based on demography/ethnicity of the newborn?
- How do we separate out the effects arising from developmental immune disorders?
- What clinical parameter should be compared to quantitatively define the severity of sepsis?.

Thank You

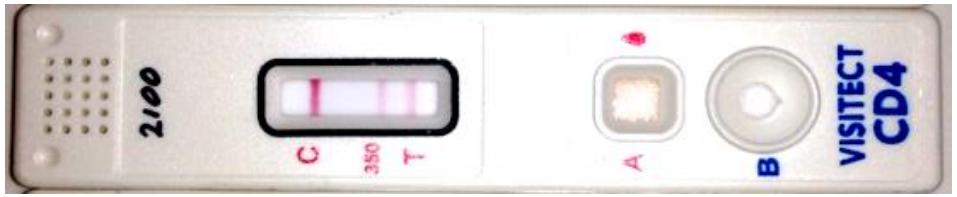
Going against the Flow: towards a lateral flow, point of care test for sepsis/severe infections

A/Prof David Anderson, Deputy Director, Burnet Institute

GARDP Webinar, 26 November 2019

“Going against the Flow” – can we use lateral flow technology (POC) instead of Flow Cytometry to measure cell-associated biomarkers?

- **CD4 T-cells (Visitect® CD4 and Visitect® CD4 Advanced Disease – Omega Diagnostics, UK)**
  - CE Mark approval, and recent Global Fund endorsement for procurement of the CD4 Advanced Disease test



- **Neutrophil CD64 as a marker of sepsis/severe infections**
  - Well documented as a sepsis biomarker using flow cytometry, with elevated levels of CD64 on both neutrophils and monocytes during severe infections, but available flow cytometry test based on neutrophils only

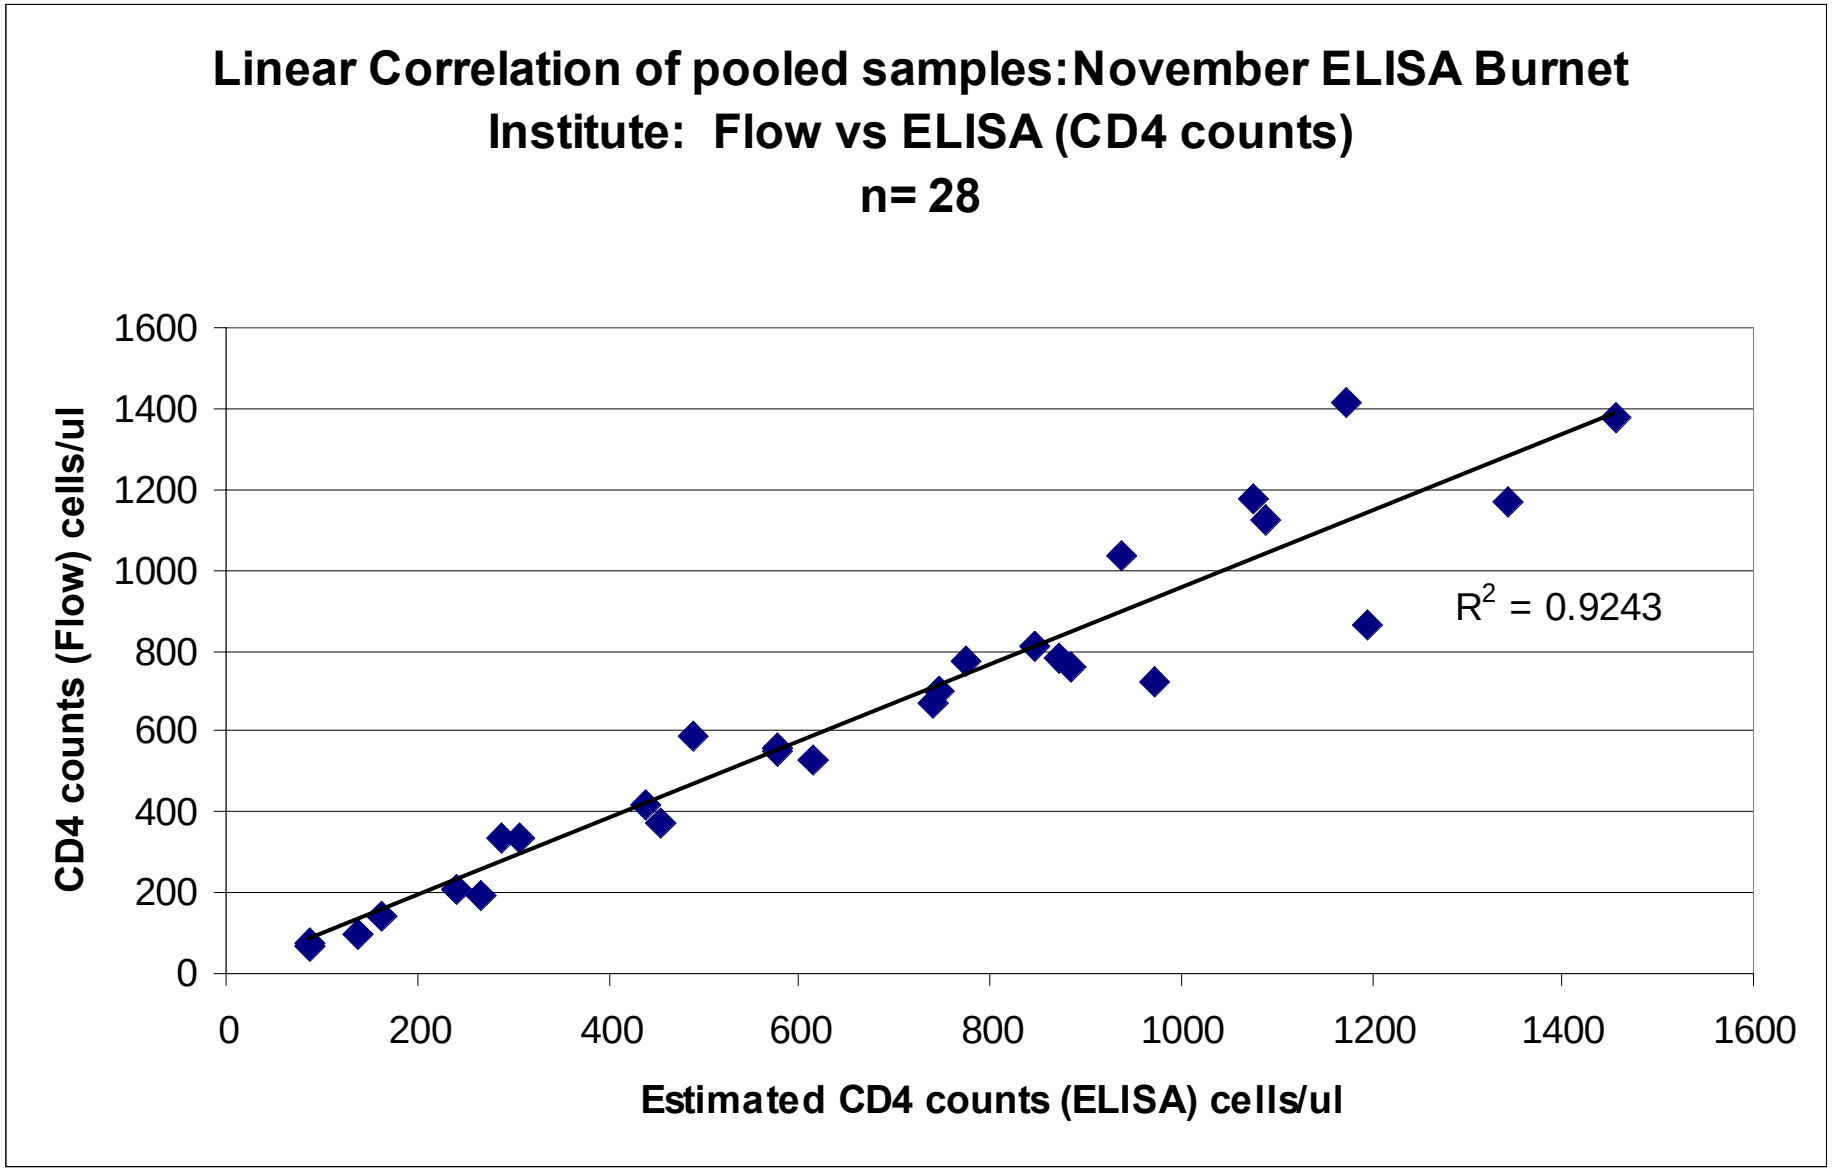
From Visitect® CD4 to sepsis/severe infections

- Burnet R&D that led to the Visitect® CD4 T-cell tests (Omega Diagnostics) solved two critical questions that are also relevant to our development of a test for sepsis/severe infection:

1) Can you measure cell-associated molecules in lateral flow, as an alternative to Flow Cytometry?

2) Can you remove monocytes from whole blood in a lateral flow device?

1. Measuring cell-associated antigen (CD4) vs Flow



CE Mark and commercial launches of tests in 2017 (350 cutoff) and 2019 (200 cutoff, Advanced Disease). Global Fund endorsement of Advanced Disease test for procurement in 2019

>90% accuracy for the Visitect® CD4 and CD4 Advanced Disease test using visual readout in multiple trial sites across India, UK, and Sub-Saharan Africa

CD64 in sepsis/severe infections

- Sepsis kills around 8 million people each year, mostly neonates and young children plus the elderly – #1 cause of death in hospitalised patients, and major cause of death in HIV patients with Advanced Disease (CD4 <200)
- Urgent need for rapid diagnosis to identify severe bacterial infections requiring antibiotic treatment, while reducing over-treatment / prophylaxis
- Neutrophil CD64 expression (by flow cytometry) is one of the most robust single biomarkers, but utility is severely limited by access to flow cytometry
  - Monocytes show high basal level of CD64, up-regulated by IFN-gamma etc during infection
  - Neutrophils show negligible basal CD64, but high levels during infection in MOST patients, when tested using flow cytometry

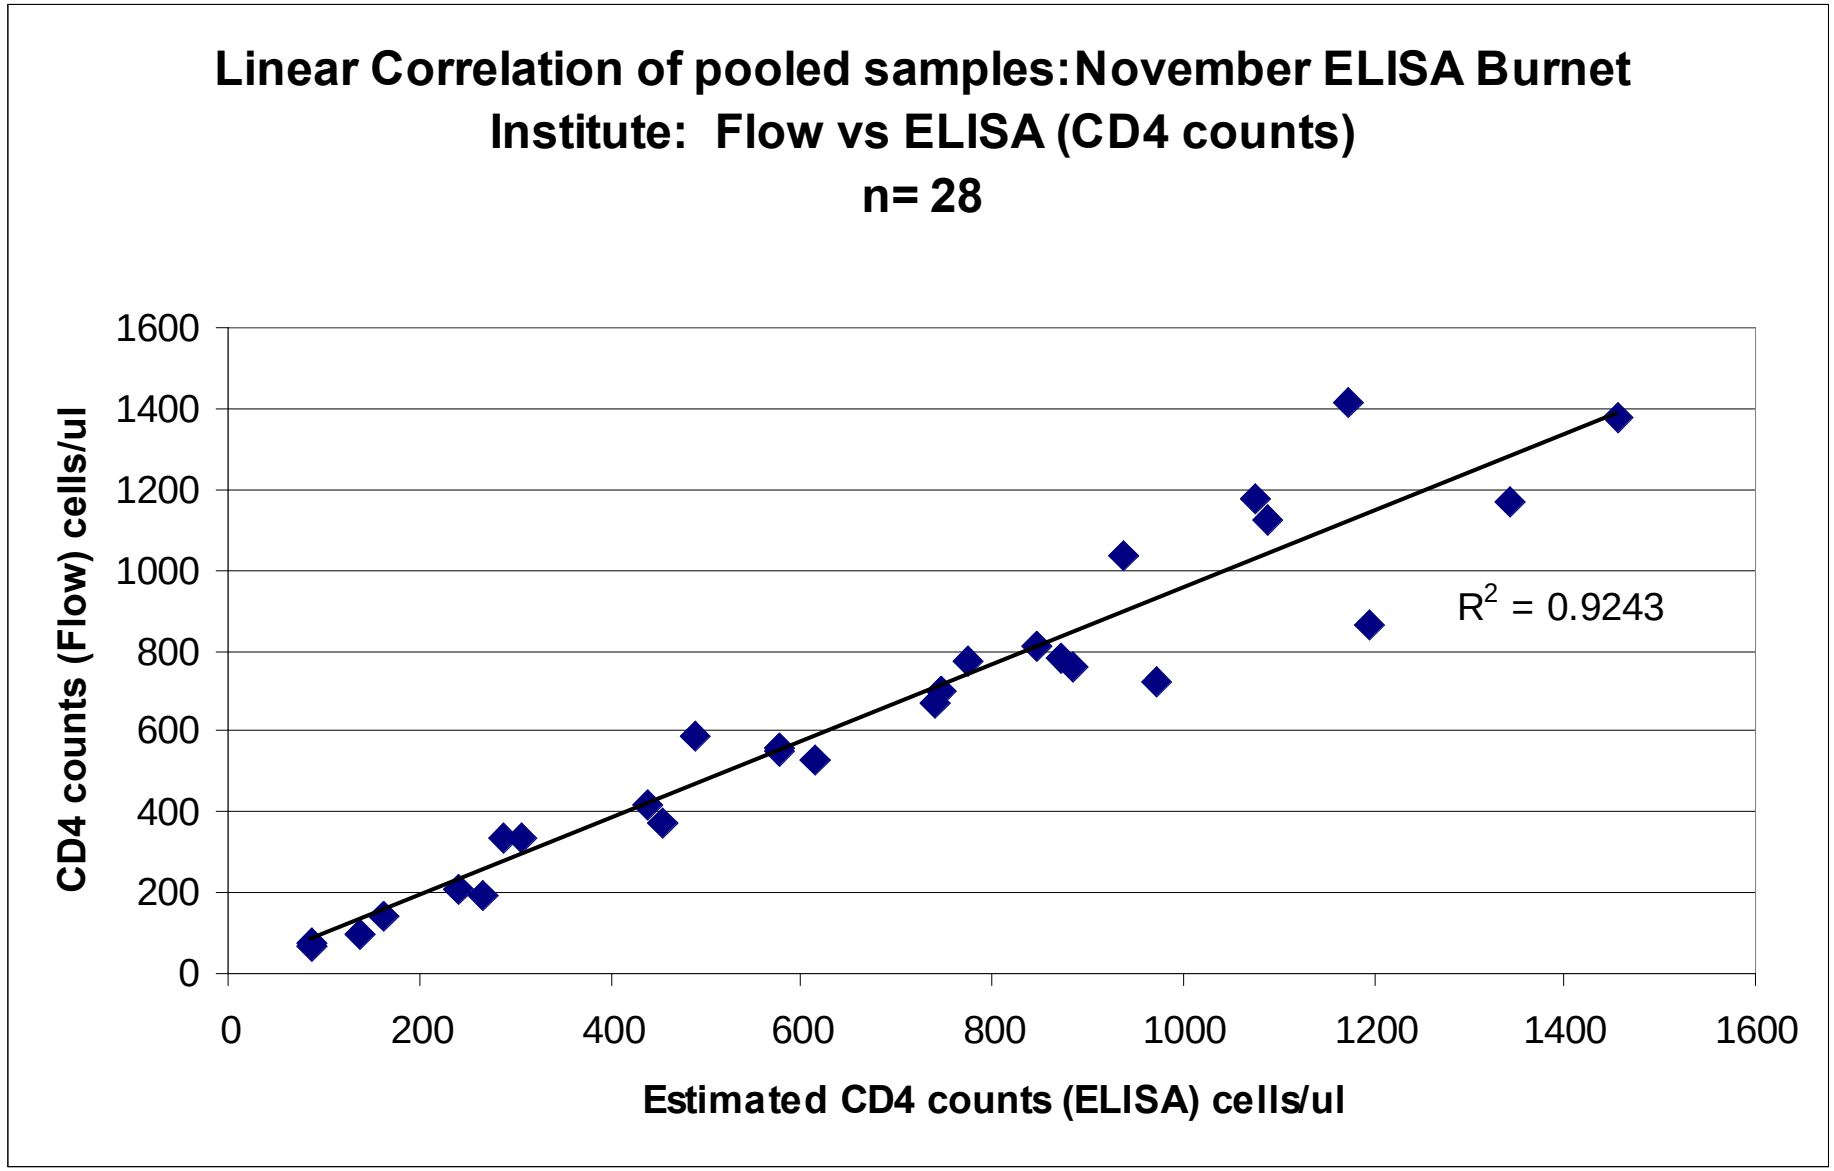
Can we adapt “neutrophil CD64” for POC?

- Adaptation of the neutrophil CD64 index test (Leuko64) to point of care using the same approach as CD4 T-cell test
  - But surprising discoveries along the way….

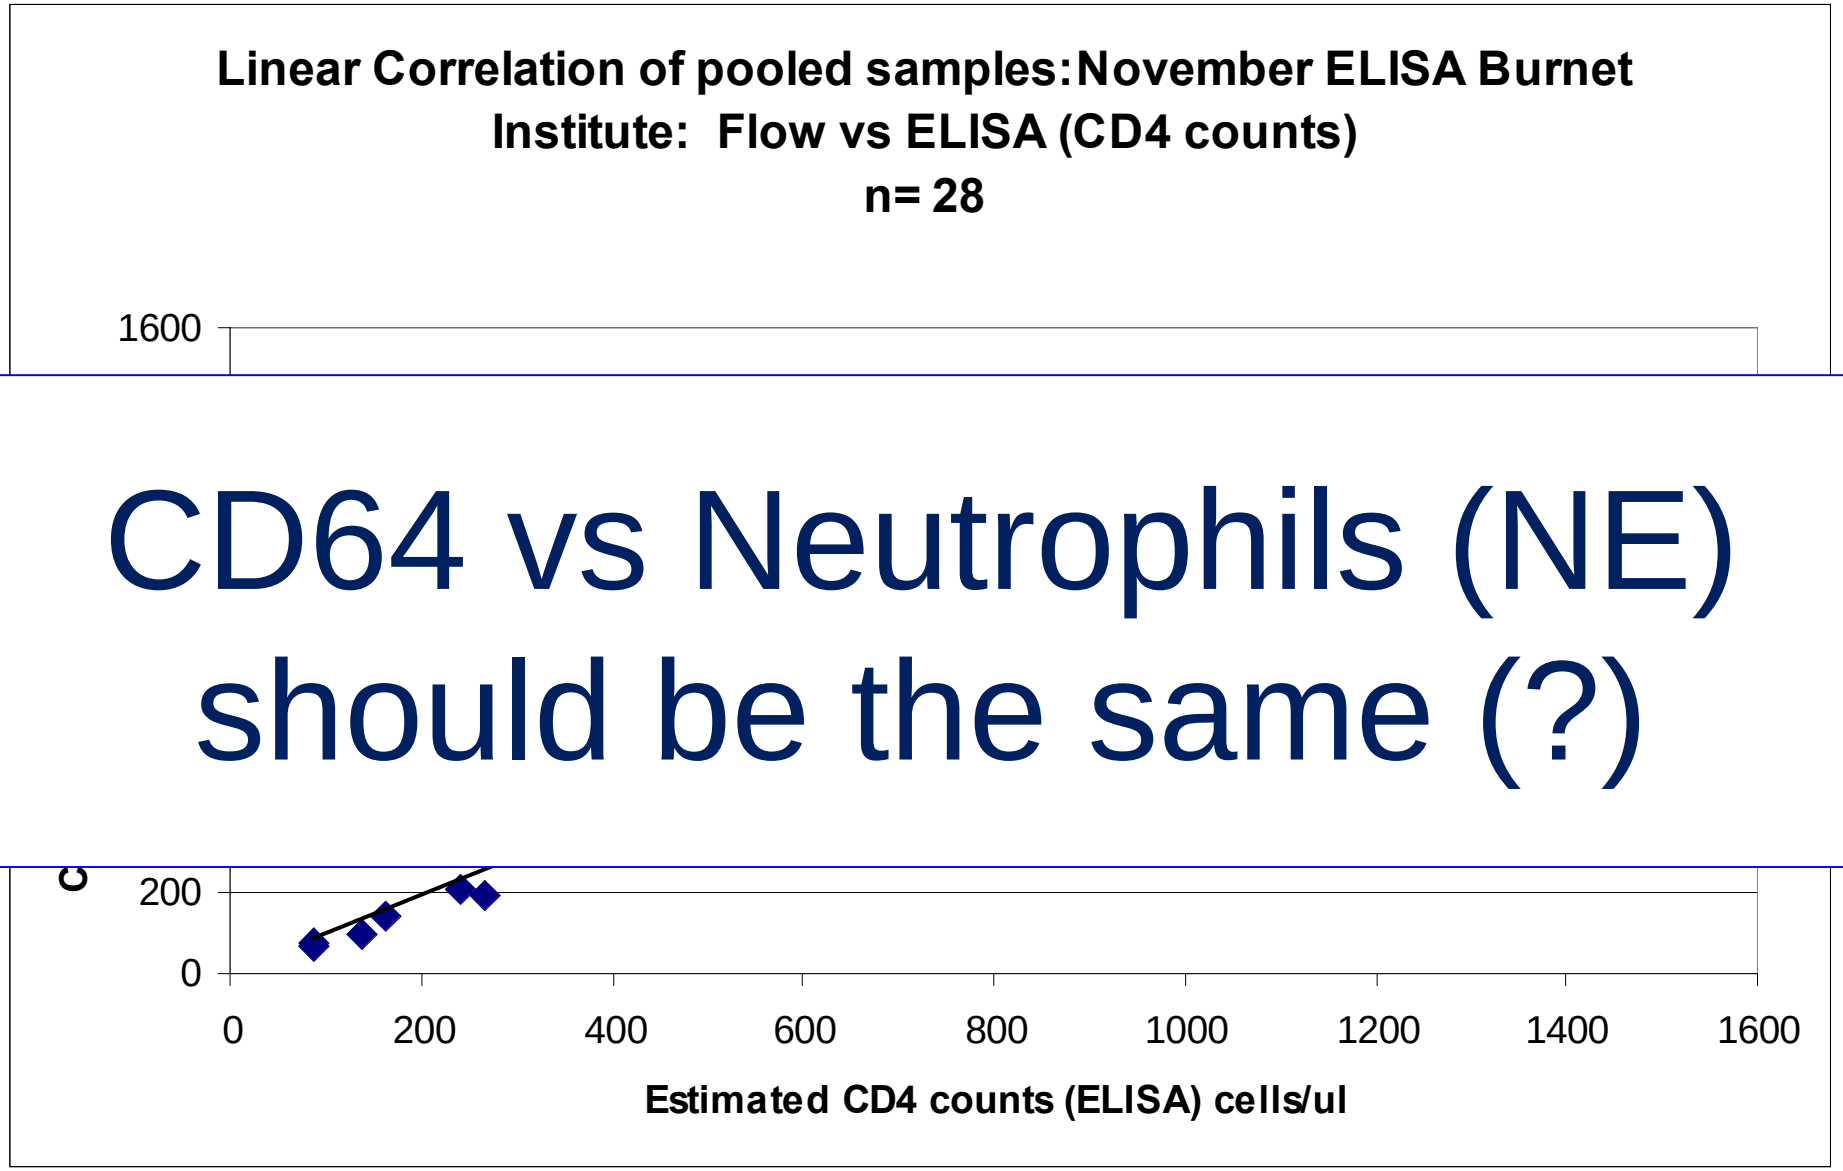
- Measuring NE as an indication of neutrophil numbers (just like CD4), and the total amount of CD64 in **whole blood**

- Ongoing clinical study (lab-based ELISAs) in healthy and ICU controls and sepsis patients (Sepsis-3 criteria), Alfred Hospital, Melbourne; and in neonates (referred to lab for suspicion of sepsis or severe infection), Royal Children’s Hospital, Melbourne, and Royal Hobart Hospital, Hobart

CD4 vs CD4 T-cells is linear



CD4 vs CD4 T-cells is linear



CD64 vs Neutrophils (NE) should be the same (?)
